1 Scope

This document defines the web service interface for the configuration of recording of Video, Audio and Metadata. Additionally associated events are defined.

The overview section provides a definition of the ONVIF storage model. This is common for all ONVIF storage related services.

Web service usage is outside of the scope of this document. Please refer to the ONVIF core specification.

2 Normative references

ONVIF Core Specification

http://www.onvif.org/specs/core/ONVIF-Core-Specification-v220.pdf

3 Terms and Definitions

3.1 Definitions

Metadata All streaming data except video and audio, including video analytics results, PTZ

position data and other metadata (such as textual data from POS applications).

Recording A container for a set of audio, video and metadata tracks. A recording can hold one or

more tracks. A track is viewed as an infinite timeline that holds data at certain times.

Recording Event An event associated with a Recording, represented by a notification message in the

APIs

Recording Job A job performs the transfer of data from a data source to a particular recording using a

particular configuration

Track An individual data channel consisting of video, audio, or metadata. This definition is

consistent with the definition of track in [RFC 2326]

Video Analytics Algorithms or programs used to analyze video data and to generate data describing

object location and behaviour.

3.2 Abbreviations

ONVIF Open Network Video Interface Forum

4 Overview

4.1 Storage

This standard provides a set of interfaces that enable the support of interoperable network storage devices, such as network video recorders (NVR), digital video recorders (DVR) and cameras with embedded storage.

The following functions are supported:

- Recording Control
- Search
- Replay

These functions are provided by three interrelated services:

Recording service enables a client to manage recordings, and to configure the transfer of data from data sources to recordings. Managing recordings includes creation and deletion of recordings and tracks.

Search service enables a client to find information about the recordings on the storage device, for example to construct a "timeline" view, and to find data of interest within a set of recordings. The latter is achieved by searching for events that are included in the metadata track recording,

Replay service enables a client to play back recorded data, including video, audio and metadata. Functions are provided to start and stop playback and to change speed and direction of the replayed stream. It also enables a client to download data from the storage device so that export functionality can be provided.

WSDL for this service is specified in http://www.onvif.org/onvif/ver10/recording.wsdl.

4.1.1 Storage Model

The storage interfaces in this standard present a logical view of the data on the storage device. This view is completely independent of the way data might be physically stored on disk.

The key concept in the storage model is that of a *recording*. The term *recording* is used in this specification to denote a container for a set of related audio, video and metadata *tracks*, typically from the same data source e.g. a camera. A *recording* could hold any number of tracks. A *track* is viewed as an infinite timeline that holds data at certain times.

At a minimum, a recording is capable of holding three tracks, one for audio, one for video and one for metadata. Some implementations of the recording service may support multiple tracks of each type. For example the same recording could hold two video tracks, one containing a low resolution or low frame rate stream and one containing a high resolution or high frame rate stream.

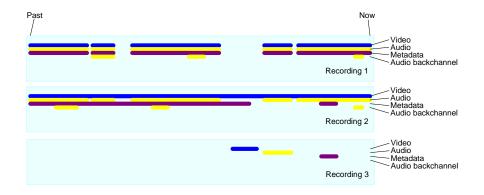

Figure 1: Storage Model with Tracks

It is important to note that the storage interfaces do not expose the internal storage structures on the device. In particular, a recording is not intended to represent a single file on disk although in many storage device implementations a recording is physically stored in a series of files. For instance, some camera implementations realise alarm recording by creating a distinct file for each alarm that occurs. Although each file could be represented as a different recording, the intent of the model in this standard is that all these files are aggregated into a single recording.

Within a recording the regions where data is actually recorded are represented by pairs of events, where each pair comprises an event when recording started and an event when recording stopped. A client can construct the logical view of the recordings by using the FindRecordings and FindEvents methods of the search service.

If metadata is recorded, the metadata track can hold all the events generated by the data source (see the chapter on event handling and the MetadataConfiguration object). In addition, a device also conceptually records ONVIF defined historical events (see Recording Event Descriptions in the search service), this includes information like start and end of a recorded data range. A device may also conceptually record vendor specific historical events. Events generated by the device are not inserted in existing metadata tracks of recordings. The FindEvents method in the search service can find all the recorded events.

4.1.2 Recording

The recording service enables a client to manage recordings, and to configure the transfer of data from data sources to recordings. Managing recordings includes creation and deletion of recordings and tracks.

Recording jobs transfer data from a recording source to a recording. A recording source can be a receiver object created with the receiver service, or it can be a media profile that encodes data on a local device. The media profile could be used as a source on a camera with embedded storage.

To save data to a recording, a client first creates a recording and ensures that the recording has the necessary tracks. Then the client creates a recording job that pulls data from one or more sources and stores the data to the tracks in the recording.

Clients may set up multiple recording jobs that all record into the same recording. If multiple recording jobs are active, the device uses a priority scheme to select between the tracks defined in the recording jobs. Clients may change the mode of recording jobs at any time, thereby providing means to implement features like alarm recording or manual recording.

The recording job relies on the receiver service for receiving the data from other devices through receiver objects identified by ReceiverTokens

5 Recording control

5.1 Introduction

The recording service enables a client to manage recordings, and to configure the transfer of data from data sources to recordings. Managing recordings includes creation and deletion of recordings and tracks, as well as locking and unlocking ranges of recordings and deletion of recorded data.

Recording jobs transfer data from a recording source to a recording. A recording source can be a receiver object created with the receiver service, or it can be a media profile that encodes data on a local device. The media profile could be used as a source on a camera with embedded storage.

The term *recording* is used in this specification to denote a container for a set of audio, video and metadata tracks. A recording could hold any number of tracks. A track is viewed as an infinite timeline that holds data at certain times.

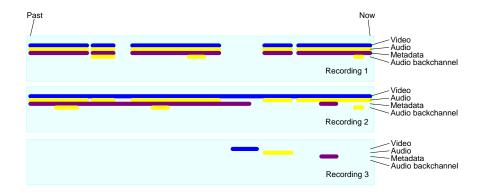

Figure 2: Example of recordings and tracks

The figure shows three recordings, each with a video, a metadata and two audio tracks. Here second audio track is used for storing the audio backchannel.

At a minimum, a recording shall be capable of holding three tracks, one for audio, one for video and one for metadata. Some implementations of the recording service may support multiple tracks of each type. All recorded data of a track shall have the same encoding.

To save data to a recording, a client first creates a recording and ensures that the recording has the necessary tracks. Then the client creates a recording job that pulls data from one or more sources and stores the data to the tracks in the recording.

Clients may set up multiple recording jobs that all record into the same recording. If multiple recording jobs are active, the device uses a priority scheme to select between the tracks defined in the recording jobs. Clients may change the mode of recording jobs at any time, thereby providing means to implement features like alarm recording or manual recording.

The recording job relies on the receiver service for receiving the data from other devices through receiver objects identified by ReceiverTokens

For the cases where a client uses a receiver object with a single recording job, the recording service can auto create and auto delete receiver objects. Autocreation is signalled with the AutoCreateReceiver flag in the recording job configuration structure. Receiver objects created this way shall be automatically deleted when no recording job uses them anymore. A receiver object that is automatically created shall have all its fields set to empty values. The client should configure the receiver object after it has created the recording job.

The ONVIF view of recordings is a logical one which is independent of the way recordings are physically stored on disk. For instance, some camera implementations realise alarm recording by creating a distinct file on a FAT file system for each alarm that occurs. Although each file could be represented as a different ONVIF recording, the intent of the model in this standard is that all these files are aggregated into a single recording. By searching for the "DataPresent" event with the FindEvents method of the search service, a client can locate the times at which video started to be recorded and where video stopped being recorded.

If Metadata is recorded, the metadata can also hold all the events generated by the data source (see section event handling of the ONVIF Core Specification and section on Metadata configuration in the ONVIF Media Service Specification). In addition, a device also conceptually record ONVIF defined historical events (see Recording Event Descriptions in the search service), this includes information like start and end of a recorded data range. A device may also conceptually record vendor specific historical events. Events generated by the device are not inserted in existing metadata tracks of recordings. The FindEvents method in the search service can find all the recorded events. Many device implementations will automatically delete the oldest recorded data from storage in order to free up space for new recordings. Locks provide a mechanism to allow a user to select ranges of data. A range of data that is locked does not get deleted automatically. Support for locks is reserved for future versions of the specification.

5.2 General Requirements

All the objects created within the recording service shall be persistent – i.e. they shall survive a power cycle. Likewise, all the configuration data in the objects shall be persistent.

5.3 Data structures

5.3.1 RecordingConfiguration

The RecordingConfiguration structure shall be used to configure recordings through CreateRecordings and Get/SetRecordingConfiguration.

MaximumRetentionTime specifies the maximum time that data in any track within the recording shall be stored. The device shall delete any data older than the maximum retention time. Such data shall not be accessible anymore. If the MaximumRetentionPeriod is set to 0, the device shall not limit the retention time of stored data, except by resource constraints. Whatever the value of MaximumRetentionTime, the device may automatically delete recordings to free up storage space for new recordings.

None of the other fields defined in this structure shall be used by the device. Instead, it simply stores this information, and it shall return it through the *GetRecordingConfiguration* and *GetRecordingInformation* (see ONVIF Recording Search Service Specification) methods.

A device may truncate any descriptive string without causing a fault if it exceeds the supported length. Descriptive strings are Location, Description and Content.

5.3.2 TrackConfiguration

The TrackConfiguration structure shall be used to configure tracks using CreateTrack and Get/SetTrackConfiguration

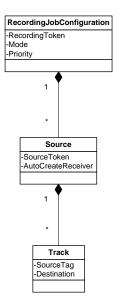

The TrackConfiguration contains the following fields:

The **TrackType** defines the data type of the track. It shall be equal to the strings "Video", "Audio" or "Metadata". The track shall only be able to hold data of that type.

None of the other fields defined in this structure shall be used by the device. Instead, it simply stores this information, and it shall return it through the *GetTrackConfiguration* and *GetRecordingInformation* (see ONVIF Recording Search Service Specification) methods.

5.3.3 RecordingJobConfiguration

The RecordingJobConfiguration structure shall hold the configuration for a recording job. As a UML diagram, the RecordingJobConfiguration can be viewed as:

The RecordingJobConfiguration holds the following fields:

RecordingToken: Identifies the recording to which this job shall store the received data.

Mode: If it is idle, nothing shall happen. If it is active and the recording job has the highest priority, the device shall try to obtain data from the receivers. A client shall use GetRecordingJobState to determine if data transfer is really taking place. The only valid values for Mode shall be "Idle" and "Active".

Priority: This shall be a non-negative number. If there are multiple recording jobs that store data to the same track, the device will only store the data for the recording job with the highest priority. The priority is specified per recording job, but the device shall determine the priority of each track individually. If there are two recording jobs with the same priority, the device shall record the data corresponding to the recording job that was activated the latest.

The value 0 indicates the lowest priority. Higher values shall indicate a higher priority.

SourceToken: This field shall be a reference to the source of the data. The type of the source is determined by the attribute Type in the SourceToken structure. If Type is http://www.onvif.org/ver10/schema/Receiver, the token is a ReceiverReference. In this case the device shall receive the data over the network. If Type is http://www.onvif.org/ver10/schema/Profile, the token identifies a media profile, instructing the device to obtain data from a profile that exists on the local device.

A device that includes the ONVIF Media Service shall support a Media Profile token and a device that includes the ONVIF Receiver Service shall support a Receiver token.

If the SourceToken is omitted. AutoCreateRecevier shall be true.

AutoCreateReceiver: If this field is TRUE, and if the **SourceToken** is omitted, the device shall create a receiver object (through the receiver service) and assign the ReceiverReference to the **SourceToken** field. When retrieving the RecordingJobConfiguration from the device, the **AutoCreateReceiver** field shall never be present.

SourceTag: If the received RTSP stream contains multiple tracks of the same type, the **SourceTag** differentiates between those Tracks.

Destination: The destination is the track token of the track to which the device shall store the received data. All tracks must belong to the recording identified by the RecordingToken.

The TrackInformation field for a Track holds a single Source. In case multiple RecordingJobs with differing Source are recording to the same Track it is undefined which of them is reported in the corresponding TrackInformation of the RecordingSearch API.

5.4 CreateRecording

CreateRecording shall create a new recording. The new recording shall be created with a track for each supported *TrackType* see section 5.21.

This method is optional. It shall be available if the Recording/DynamicRecordings capability is TRUE.

Table 2: CreateRecording command

CreateRecording	Access Class: ACTUATE	
Message name	Description	
CreateRecordingRequest	Contains the initial con	figuration for the recording
	tt:RecordingConfigurati	ion RecordingConfiguration [1][1]
CreateRecordingResponse	Returns the reference to	the created recroding
	tt:RecordingReference	RecordingToken[1][1]
Fault codes	Description	
env:Receiver	The device cannot creat	te a new recording because it already
ter:Action	has the maximum numb	er of recordings that it supports.
ter:MaxRecordings		
env:Sender	The RecordConfiguration	on is invalid.
ter:InvalidArgVal		
ter:BadConfiguration		
env:Receiver	This optinal method is r	ot implemented
ter:ActionNotSupported		
ter:NotImplemented		

When successfully completed, CreateRecording shall have created three tracks with the following configurations:

TrackToken	TrackType
VIDEO001	Video
AUDIO001	Audio

META001	Metadata

The RecordingConfiguration shall have the MaximumRetentionTime set to 0 (unlimited) and all TrackConfigurations shall have the Description set to the empty string.

5.5 DeleteRecording

DeleteRecording shall delete a recording object. Whenever a recording is deleted, the device shall delete all the tracks that are part of the recording, and it shall delete all the Recording Jobs that record into the recording. For each deleted recording job, the device shall also delete all the receiver objects associated with the recording job that are automatically created using the AutoCreateReceiver field of the recording job configuration structure and are not used in any other recording job.

This method is optional. It shall be available if the Recording/DynamicRecordings capability is TRUE.

Table 3: DeleteRecording command

DeleteRecording		Access Class: ACTUATE	
Message name	Description	Description	
DeleteRecordingRequest		Identifies the recording that shall be deleted tt:RecordingReference RecordingToken[1][1]

5.9 CreateTrack

This method shall create a new track within a recording if the method GetRecordingOptions signals spare tracks for the recording. For a track to be created the SpareXXX (where XXX is the track type) needs to be set.

This method is optional. It shall be available if the Recording/DynamicTracks capability is TRUE.

Table 7: CreateTrack command

CreateTrack		Access Class: ACTUATE	
Message name	Description		
CreateTrackRequest	track shall be added. The the configuration for the tt:RecordingReference I	The Recording Token shall identify the recording to which a track shall be added. env:Receiver	If the AutoCreateReceivers flag is TRUE, this error can be
ter:Action	returned if the receiver service cannot create a new receiver.
ter:MaxReceivers	
env:Sender	The RecordingToken does not reference an exsiting
ter:InvalidArgVal	recording.
ter:NoRecording	

The **JobConfiguration** returned from CreateRecordingJob shall be identical to the **JobConfiguration** passed into CreateRecordingJob, except for the ReceiverToken and the AutoCreateReceiver. In the returned structure, the ReceiverToken shall be present and valid and the AutoCreateReceiver field shall be omitted.

5.14 DeleteRecordingJob

DeleteRecordingJob removes a recording job. It shall also implicitly delete all the receiver objects associated with the recording job that are automatically created using the AutoCreateReceiver field of the recording job configuration structure and are not used in any other recording job.

Table 12: DeleteRecordingJob command

DeleteRecordingJob		Access Class: ACTUATE

ter:InvalidArgVal	
ter:BadMode	

5.19 GetRecordingJobState

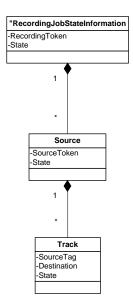

GetRecordingJobState returns the state of a recording job. It includes an aggregated state, and state for each track of the recording job. The RecordingJogState may change due to

- calls that effect the RecordingJobMode, e.g. SetRecordingJobMode,
- internal recording engine state changes,
- changes in the recorded local media profile or
- changes to the RTSP connection defined by the associated Receiver.

Table 17: GetRecordingJobState command

GetRecordingJobState		Access Class: READ_MEDIA
Message name Description		
GetRecordingJobState Request	The JobToken shall identify the recording job for which to get the state. tt:RecordingJobReference JobToken [1][1]	
GetRecordingJobState Response	The State shall hold the state of the recording job. tt:RecordingJobStateInformation State[1][1]	
Fault codes	Description	
env:Sender ter:InvalidArgVal ter:NoRecordingJob	The JobToken does not	reference an existing job

The UML representation of the RecordingJobStateInformation structure is:

RecordingToken shall be the identification of the recording that the recording job records to.

State (as part of RecordingJobStateInformation) shall hold the aggregated state over the whole RecordingJobInformation structure.

SourceToken shall identify the data source of the recording job.

State (as part of RecordingJobStateSource) shall hold the aggregated state over all substructures of RecordingJobStateSource.

SourceTag shall identify the track of the data source that provides the data.

Destination shall indicate the destination track

State (as part of RecordingJobTrackState) shall provide the job state of the track. The valid values of state shall be "Idle", "Active" and "Error". If state equals "Error", the Error field may be filled in with an implementation defined value.

Error, optional string describing the error state. The string should be in English. The following values are predefined:

"Incompatible Stream" – The stream cannot be recorded because the encoding does not match to previously recorded data.

A device shall apply the following rules to compute aggregate state

Idle	All state values in sub-nodes are "idle"	
PartiallyActive	The state of some sub-nodes are "active" and some sub-nodes are "idle"	
Active	The state of all sub-nodes is "Active"	
Error	At least one of the sub-nodes has state "Error"	

5.20 GetRecordingOptions

GetRecordingOptions returns information for a recording identified by the RecordingToken. The information includes the number of additional tracks as well as recording jobs that can be configured.

This method shall be supported if the Options support is signaled via the capabilities.

Note that this information is not static and is only guaranteed to be valid until the next modification of any recording jobs or tracks.

The track options shall be supported if the device signals support for dynamic tracks.

Table 18: GetRecordingOptions command

GetRecordingOptions		Access Class: READ_MEDIA
Message name	Description	
GetRecordingOptionsRequest	The RecordingToken identifies the recording. tt:RecordingReference RecordingToken[1][1]	
GetRecordingOptionsResponse	tt:RecordingReference RecordingToken[1][1] The JobOptions contain two attributes: Spare Number of spare jobs that can be created for the recording. By setting none of the Spare attribute the device signals that no job can be created. CompatibleSources A device that supports recording of a restricted set of Media Service Profiles shall return the list of profiles that can be recorded on the given Recording. The TrackOptions contain four attributes: SpareTotal Total spare number of tracks that can be added to this recording. SpareVideo Number of spare video tracks for this recording SpareAudio Number of spare audio tracks for this recording SpareMetadata Number of spare metadata tracks for this recording By setting none of the SpareXXX attributes the device signals that no track can be added. trc:JobOptions JobOptions[1][1]	
Fault codes	Description	
env:Sender ter:InvalidArgVal ter:NoRecording	The RecordingToken do recording.	oes not reference an existing

5.21 ExportRecordedData

ExportRecordedData exports the selected recordings to the given storage target. The input parameters contains the search scope, file format, and storage destination. The search scope

parameter indicates the selection criterion on the existing recordings. The file format parameter indicates which export file format to be used. The device shall select the configuration defined in the ONVIF Export File Format Specification when this parameter is omitted. The storage destination parameter indicating the target storage and relative directory path.

The device shall implement ExportRecordedData command when the optional SupportedExportFileFormats capability returns list of supported export file formats. The FileFormat parameter shall use a value listed in the SupportedExportFileFormats capability.

Table 19 ExportRecordedData command

ExportRecordedData		Access Class: READ_MEDIA
Message name Description		
ExportRecordedDataRequest	The SearchScope defines the selection criterion for the existing recordings and StorageDestination indicates the destination storage and optional path. tt:SearchScope SearchScope[1][1] xs:string FileFormat[1][1]	
ExportRecordedDataResponse	tt:StorageReferencePath StorageDestination[1][1] This message shall return the asynchronous operation token for associating the received event with this invocation. tt:ReferenceToken OperationToken[1][1]. xs:string FileNames[0][unbounded]	
Fault codes	Description	
env:Sender ter:InvalidArgVal ter:BadConfiguration	The device cannot supported files.	ort the selected FileFormat for

The ExportRecordedDataResponse returns the unique operation token that is used by client to monitor the progress of this invocation. The progress of export recordings operation is obtained via an event (Core Spec, Monitoring/AsynchronousOperationStatus). A device can notify progress of exported files via optional FileProgressStatus (tt:ArrayOfFileProgress) element, containining an array of file name and completion percentage of file upload from device's point of view. The value of completion percentage is normalized between 0.0 and 1.0 where 1.0 indicates 100% completion of file upload. The optional FileProgressStatus elemet is sent in Data section of a Message.

If a delete recording request is issued during an export of recordings and there are common recordings, the device shall delete the relevant recording after completing the export of these relavant recordings.

5.22 StopExportRecordedData

Stops the ExportRecordedData operation that is started before, The response message lists the status of the exported files.

Table 20 StopExportRecordedData command

StopExportRecordedData		Access Class: READ_MEDIA
Message name Description		
StopExportRecordedDataReque st	The OperationToken refers to the started ExportRecordedData operation. tt:ReferenceToken OperationToken[1][1]	
StopExportRecordedDataRespo nse	This message shall return status of exported files by the export recorded data operation xs:float Progress; tt:ArrayOfFileProgress FileProgressStatus[1][1]	
Fault codes	Description	
env:Sender ter:InvalidArgVal ter:BadConfiguration	The requested operation	n does not exist.

5.23 GetExportRecordedDataState

GetExportRecordedDataState returns the status of export operations. This interface allows client to poll the status information from the device.

Table 21 GetExportRecordedDataState

GetExportRecordedDataState		Access Class: READ_MEDIA
Message name Description		
GetExportRecordedDataStateRe quest	The OperationToken refers to the started ExportRecordedData operation. tt:ReferenceToken OperationToken[1][1]	
GetExportRecordedDataStateRe sponse	This message shall return status of export recorded data operation. xs:float Progress; tt:ArrayOfFileProgress FileProgressStatus[1][1].	
Fault codes	Description	
env:Sender ter:InvalidArgVal ter:BadConfiguration	The requested operation	n does not exist.

5.24 Capabilities

The capabilities reflect optional functions and functionality of a service. The information is static and does not change during device operation. The following \Box capabilities are available:

DynamicRecordings Indication if the device supports dynamic creation and deletion of recordings.

DynamicTracks Indication if the device supports dynamic creation and deletion of tracks.

Encoding Indication which encodings are supported for recording. The list may

contain one or more enumeration values of tt:VideoEncoding and tt:AudioEncoding. If device does not support audio recording

tt:AudioEncoding shall not be listed.

MaxRate Maximum supported bit rate for all tracks of a recording in kBit/s.

MaxTotalRate Maximum supported bit rate for all recordings in kBit/s.

MaxRecordings Maximum number of recordings supported.

MaxRecordingJobs Maximum total number of supported recording jobs by the device.

Options Indication if the device supports the GetRecordingOptions command.

MetadataRecording Indication if the device supports recording metadata.

SupportedExportFileFormats indication that the device supports

ExportRecordedData command for the listed export file formats. The list shall return at least one export file format value. The value of 'ONVIF'

refers to ONVIF Export File Format Specification.

Table 22: GetServiceCapabilities command

GetServiceCapabilities		Access Class: PRE_AUTH
Message name Description		
GetServiceCapabilitiesReque st	This is an empty message.	
GetServiceCapabilitiesRespo nse	The capability response message contains the requested service capabilities using a hierarchical XML capability structure. trc:Capabilities Capabilities [1][1]	
Fault codes	Description	
	No command specific faults!	

5.25 Events

The recording service shall dispatch events through the event service. It shall be capable of generating the events listed in this chapter whenever the condition that fires the event occurs.

Some of these events are similar to the automatically generated events that can be searched for by the FindEvents method in the search service. See ONVIF Recording Search Service Specification.

5.25.1 Recording job state changes

If the a state field of the RecordingJobStateInformation structure changes, the device shall send the event:

```
Topic: tnsl:RecordingConfig/JobState
<tt:MessageDescription IsProperty="true">
    <tt:Source>
        <tt:SimpleItemDescription Name="RecordingJobToken"
Type="tt:RecordingJobReference"/>
        </tt:Source>
        <tt:Data>
        <tt:SimpleItemDescription Name="State" Type="xs:String"/>
        <tt:ElementItemDescription Name="Information"
Type="tt:RecordingJobStateInformation"/>
        </tt:Data>
        </tt:Data>
        </tt:MessageDescription>
```

5.25.2 Configuration changes

If the configuration of a recording is changed, the device shall send the event:

If the configuration of a track is changed, the device shall send the event:

If the configuration of a recording job is changed, the device shall send the event:

5.25.3 Data deletion

Whenever data is deleted, the device shall send the event:

```
Topic: tnsl:RecordingConfig/DeleteTrackData
<tt:MessageDescription IsProperty="false">
    <tt:Source>
        <tt:SimpleItemDescription Name="RecordingToken" Type="tt:RecordingReference"/>
        <tt:SimpleItemDescription Name="TrackToken" Type="tt:TrackReference"/>
        </tt:Source>
        <tt:Data>
        <tt:SimpleItemDescription Name="StartTime" Type="xsDateTime"/>
        <tt:SimpleItemDescription Name="EndTime" Type="xsDateTime"/>
        </tt:Data></tt:Data></tt:Data></tt:Data></tt:Data></tt:Data></tt:Data></tt:Data></tt:Data></tt:Data></tt:Data>
```

</tt:MessageDescription>

5.25.4 Recording and track creation and deletion

Whenever a recording is created, the device shall send the event:

Whenever a recording is deleted, the device shall send the event:

Whenever a track is created, the device shall send the event:

Whenever a track is deleted, the device shall send the event:

```
Topic: tns1:RecordingConfig/DeleteTrack
<tt:MessageDescription IsProperty="false">
    <tt:Source>
        <tt:SimpleItemDescription Name="RecordingToken" Type="tt:RecordingReference"/>
        <tt:SimpleItemDescription Name="TrackToken" Type="tt:TrackReference"/>
        </tt:Source>
        <tt:Data>
        </tt:Data>
        </tt:MessageDescription>
```

5.26 Examples

5.26.1 Example 1: setup recording of a single camera

There are two steps involved. The first step is to configure the NVS

```
; Create recording (this implicitly creates an A, V and M track)
RecordToken = CreateRecording(RecordConfiguration)

; The tracktokens are predefined. We don't have to find them on the device
TrackToken1 = "VIDEO001"
TrackToken2 = "AUDI0001"
TrackToken3 = "META001"

; Create a recording job, assume that we set mode to idle, auto create
receiver
    JobToken, ActualJobConfig = CreateRecordingJob(JobConfiguration)
```

This completes the configuration step.

Finally, to really start recording, some entity calls

```
; Activate the recording job
SetRecordingJobMode(JobToken, Active)
```

to make the job active. This will cause the NVS to set up an RTSP connection with the device.

Therefore, to start and stop recording, all that is needed is to call SetRecordingJobMode on pre-configured recording jobs. And since the embedded configuration objects are persistent, the configuration cycle only needs to be done once.

5.26.2 Example 2: Record multiple streams from one camera to a single recording

This example is very similar to example 1. The jobconfiguration will hold references to two receiver objects. Each receiver object is configured to receive from the same device, but from a different stream.

```
; Create recording (this implicitly creates an A, V and M track)
      RecordToken = CreateRecording(RecordConfiguration)
       ; The tracktokens are predefined. We don't have to find them on the device
      TrackToken1 = "VIDEO001"
      TrackToken2 = "AUDIO001"
      TrackToken3 = "META001"
       ; Create three additional tracks
      TrackToken4 = CreateTrack(RecordToken, AudioConfig)
      TrackToken5 = CreateTrack(RecordToken, VideoConfig)
      TrackToken6 = CreateTrack(RecordToken, MetadataConfig)
       ; Create a recording job, assume that we set mode to idle, auto create two
receivers
      JobToken, ActualJobConfiguration = CreateRecordingJob(JobConfiguration)
       ; Configure the receivers
      ConfigureReceiver(ActualJobConfiguration.ReceiverToken[1],
                                                      Receiver1Configuration)
       ConfigureReceiver(ActualJobConfiguration.ReceiverToken[2],
                                                      Receiver2Configuration)
```

To really start recording, some entity calls

```
; Activate the recording job SetRecordingJobMode(JobToken, Active)
```

5.27 Service specific fault codes

The table below lists the Recording Control service specific fault codes. Additionally, each command can also generate a generic fault as defined in the ONVIF Core Specification.

Table 23: Recording Control service specific fault codes

Fault Code	Parent Subcode	Fault Reason	Description
	Subcode		
env:Receiver	ter:Action ter:MaxRecordings	Cannot create new recording	New recording cannot be created due to the maximum number of recordings that the device supports.
		3	
env:Receiver	ter:Action	Cannot delete	The specifc recording/track
	ter:CannotDelete	- Carmot doloto	cannot be deleted.
env:Receiver	ter:Action	Cannot create new	New track cannot be created
	ter:MaxTracks	track	due to the maximum number of tracks that the device supports.
env:Receiver	ter:Action	Cannot create new	New recording job cannot be
	ter:MaxRecordingJobs	recording job	created due to the maximum number of jobs that the device supports.
env:Receiver	ter:Action	Cannot create new	New receiver is not
	ter:MaxReceivers	receiver	successfully created.
env:Receiver	ter:ActionNotSupported	Optinoal Action Not Implemented	The requested action is optional and is not
	ter:NotImplemented	'	implemented by the device.
env:Sender	ter:InvalidArgVal	Invalid configuration	Invalid configuration
	ter:BadConfiguration	parameters	parameter(s) provided.
env:Sender	ter:InvalidArgVal	Invalid recording	The specified recording token
	ter:NoRecording	token	does not reference an existing recording.
env:Sender		Invalid track token	The specified track token
_	ter:NoTrack		does not reference an existing track of the recording.
env:Sender	ter:InvalidArgVal	Invalid recording job	The specified recording job
	ter:NoRecordingJob	token	token does not reference an existing job.
env:Sender	ter:InvalidArgVal	Invalid mode	The ode is invalid.
	ter:BadMode		

5.28 Service specific data types

5.28.1 RecordingInformation

RecordingToken

Identifies the recording to which this job shall store the received data.

Source

Information about the source of the recording. This gives a description of where the data in the recording comes from. Since a single recording is intended to record related material, there is just one source. It is indicates the physical location or the major data source for the recording. Currently the recordingconfiguration cannot describe each individual data source.

EarliestRecording

the date and time of the oldest data in the recording

LatestRecording

the date and time of the newest data in the recording.

Content

informative description of content.

Track

Contains information about a single track in a recording.

RecordingStatus

current status of recording, can be any of: Initiated, Recording, Stopped, Removing, Removed.

5.28.2 RecordingSourceInformation

A set of informative desciptions of a data source. The Search searvice allows a client to filter on recordings based on information in this structure.

Sourceld

Identifier for the source chosen by the client that creates the structure. This identifier is opaque to the device. Clients may use any type of URI for this field. A device shall support at least 128 characters.

Name

Informative user readable name of the source, e.g. "Camera23". A device shall support at least 20 characters.

Location

Informative description of the physical location of the source, e.g. the coordinates on a map.

Description

Informative description of the source.

Address

URI provided by the service supplying data to be recorded. A device shall support at least 128 characters.

5.28.3 TrackInformation

TrackToken

an identifier of the track.

TrackType

Type of the track: "Video", "Audio" or "Metadata". The track shall only be able to hold data of that type.

Description

Informative description of the contents of the track.

DataFrom

The date and time of the oldest data in the track.

DataTo

The date and time of the newest data in the track.

5.28.4 MediaAttributes

A set of media attributes valid for a recording at a point in time or for a time interval.

RecordingToken

A reference to the recording that has these attributes.

• TrackAttributes

A set of attributes for each track.

From

The attributes are valid from this point in time in the recording.

Until

The attributes are valid until this point in time in the recording. Can be equal to 'From' to indicate that the attributes are only known to be valid for this particular point in time.

5.28.5 TrackAttributes

• TrackInformation

The basic information about the track.

VideoAttributes

If the track is a video track, exactly one of this structure shall be present and contain the video attributes.

AudioAttributes

If the track is an audio track, exactly one of this structure shall be present and contain the audio attributes.

MetadataAttributes

If the track is an metadata track, exactly one of this structure shall be present and contain the metadata attributes.

5.28.6 VideoAttributes

```
<xs:complexType name="VideoAttributes">
    <xs:element name="Bitrate" type="xs:int" minOccurs="0"/>
    <xs:element name="Width" type="xs:int"/>
    <xs:element name="Height" type="xs:int"/>
    <xs:element name="Encoding" type="tt:VideoEncoding"/>
    <xs:element name="Framerate" type="xs:float"/>
</xs:complexType>
```

Bitrate

Average bitrate in kbps.

Width

The width of the video in pixels.

Height

The height of the video in pixels.

Encoding

Used video codec, either Jpeg, H.264 or Mpeg4

Framerate

Average framerate in frames per second.

5.28.7 AudioAttributes

```
<xs:complexType name="AudioAttributes">
    <xs:element name="Bitrate" type="xs:int" minOccurs="0"/>
    <xs:element name="Encoding" type="tt:AudioEncoding"/>
    <xs:element name="Samplerate" type="xs:int"/>
</xs:complexType>
```

Bitrate

The bitrate in kbps.

Encoding

Audio codec used for encoding the audio (either G.711, G.726 or AAC)

Samplerate

The sample rate in kHz.

5.28.8 MetadataAttributes

CanContainPTZ

Indicates that there can be PTZ data in the metadata track in the specified time interval.

CanContainAnalytics

Indicates that there can be analytics data in the metadata track in the specified time interval.

CanContainNotifications

Indicates that there can be notifications in the metadata track in the specified time interval.

A device shall only set any of CanContainPTZ, CanContainAnalytics and CanContainNotifications to true if the recording actually contains the corresponding type of metadata.

5.28.9 RecordingConfiguration

```
<xs:complexType name="RecordingConfiguration">
    <xs:element name="Source" type="tt:RecordingSourceInformation"/>
    <xs:element name="Content" type="tt:Description"/>
    <xs:element name="MaximumRetentionTime" type="xs:duration"/>
    </xs:complexType>
```

Source

Information about the source of the recording.

Content

Informative description of the source.

MaximumRetentionTime

Sspecifies the maximum time that data in any track within the recording shall be stored. The device shall delete any data older than the maximum retention time. Such data shall not be accessible anymore. If the MaximumRetentionPeriod is set to 0, the device shall not limit the retention time of stored data, except by resource constraints. Whatever the value of MaximumRetentionTime, the device may automatically delete recordings to free up storage space for new recordings.

5.28.10 TrackConfiguration

```
<xs:complexType name="TrackConfiguration">
    <xs:element name="TrackType" type="tt:TrackType"/>
    <xs:element name="Description" type="tt:Description"/>
</xs:complexType>
```

TrackType

Type of the track. It shall be equal to the strings "Video", "Audio" or "Metadata". The track shall only be able to hold data of that type.

Description

Informative description of the track.

5.28.11 GetRecordingsResponseItem

```
<xs:complexType name="GetRecordingsResponseItem">
    <xs:element name="RecordingToken" type="tt:RecordingReference"/>
    <xs:element name="Configuration" type="tt:RecordingConfiguration"/>
    <xs:element name="Tracks" type="tt:GetTracksResponseList"/>
</xs:complexType>
```

• RecordingToken

Token of the recording.

Configuration

Configuration of the recording.

Tracks

List of tracks.

5.28.12 GetTracksResponseList

Track

Configuration of a track.

5.28.13 GetTracksResponseItem

```
<xs:complexType name="GetTracksResponseItem">
    <xs:element name="TrackToken" type="tt:TrackReference"/>
    <xs:element name="Configuration" type="tt:TrackConfiguration"/>
</xs:complexType>
```

TrackToken

Token of the track.

Configuration

Configuration of the track.

5.28.14 RecordingJobConfiguration

RecordingToken

Identifies the recording to which this job shall store the received data.

Mode

The mode of the job. If it is idle, nothing shall happen. If it is active, the device shall try to obtain data from the receivers. A client shall use GetRecordingJobState to determine if data transfer is really taking place.

The only valid values for Mode shall be "Idle" and "Active".

Priority

This shall be a non-negative number. If there are multiple recording jobs that store data to the same track, the device will only store the data for the recording job with the highest priority. The priority is specified per recording job, but the device shall determine the priority of each track individually. If there are two recording jobs with the same priority, the device shall record the data corresponding to the recording job that was activated the latest.

Source

Source of the recording.

5.28.15 RecordingJobSource

SourceToken

This field shall be a reference to the source of the data. The type of the source is determined by the attribute Type in the SourceToken structure. If Type is http://www.onvif.org/ver10/schema/Receiver, the token is a ReceiverReference. In this case the device shall receive the data over the network. If Type is http://www.onvif.org/ver10/schema/Profile, the token identifies a media profile, instructing the device to obtain data from a profile that exists on the local device.

AutoCreateReceiver

If this field is TRUE, and if the SourceToken is omitted, the device shall create a receiver object (through the receiver service) and assign the ReceiverReference to the SourceToken field. When retrieving the RecordingJobConfiguration from the device, the AutoCreateReceiver field shall never be present.

Tracks

List of tracks associated with the recording.

5.28.16 RecordingJobTrack

```
<xs:complexType name="RecordingJobTrack">
    <xs:element name="SourceTag" type="xs:string"/>
    <xs:element name="Destination" type="tt:TrackReference"/>
</xs:complexType>
```

SourceTag

If the received RTSP stream contains multiple tracks of the same type, the SourceTag differentiates between those Tracks. In case of the recording for local source, this field shall be ignored.

Destination

The destination is the tracktoken of the track to which the device shall store the received data.

5.28.17 RecordingJobStateInformation

RecordingToken

Identification of the recording that the recording job records to.

State

Holds the aggregated state over the whole RecordingJobInformation structure.

Sources

Identifies the data source of the recording job.

5.28.18 RecordingJobStateSource

```
<xs:complexType name="RecordingJobStateSource">
    <xs:element name="SourceToken" type= "tt:SourceReference"/>
    <xs:element name="State" type="tt:RecordingJobState"/>
    <xs:element name="Tracks" type="tt:RecordingJobStateTracks"/>
    </xs:complexType>
```

SourceToken

Identifies the data source of the recording job.

State

Holds the aggregated state over all substructures of RecordingJobStateSource.

Tracks

List of track items.

5.28.19 RecordingJobStateTracks

Track

an identifier of the track.

5.28.20 RecordingJobStateTrack

SourceTag

Identifies the track of the data source that provides the data.

Destination

Indicates the destination track.

Error

Optionally holds an implementation defined string value that describes the error. The string should be in the English language.

State

Provides the job state of the track. The valid values of state shall be "Idle", "Active" and "Error". If state equals "Error", the Error field may be filled in with an implementation defined value.

5.28.21 GetRecordingJobsResponseItem

JobToken

identifier of a job.

JobConfiguration

holds the configuration for a recording job

5.28.22 StorageReferencePath

```
<xs:complexType name="StorageReferencePath">
    <xs:element name="StorageToken" type="tt:ReferenceToken"/>
    <xs:element name="RelativePath" type="xs:string" minOccurs="0"/>
</xs:complexType>
```

StorageToken

identifier of an existing Storage Configuration.

RelativePath

gives the relative directory path on the selected storage.

Annex A. Example scenario for Recording Job Priority (Informative)

This annex describes a scenario for Multiple Recording Jobs configured to record data into a single recording.

As described in Section 5.3, "If there are two recording jobs with the same priority, the device shall record the data corresponding to the recording job that was activated the latest."

Accordingly, a device supporting Multiple Recording Jobs is required to change the Job Modes of Recording Jobs with respect to Priority, as described below:

Step 1: A Recording Job 'J1' with Priority '1' is created in 'Active' mode Job Modes of Recording Jobs after Step 1: Recording Job 'J1' = ACTIVE

Step 2: A new Recording Job 'J2' with Priority '1' is now created in 'Active' mode Job Modes of Recording Jobs after Step 2:

Recording Job 'J1' = IDLE Recording Job 'J2' = ACTIVE

Step 3: Another Recording Job 'J3' with higher Priority '2' is now created in 'Active' mode.

Because it has a higher priority than J2, it takes precedence.

Job Modes of Recording Jobs after Step 3:

Recording Job 'J1' = IDLE Recording Job 'J2' = IDLE Recording Job 'J3' = ACTIVE

Step 4. Recording Job 'J3' is now deleted, 'J1' and 'J2' are both at the highest priority, so Section 5.14 applies, and the device can activate either 'J1' or 'J2'.

Job Modes of Recording Jobs after Step 4, possibility 1:

Recording Job 'J1' = ACTIVE Recording Job 'J2' = IDLE

Job Modes of Recording Jobs after Step 4, possibility 2:

Recording Job 'J1' = IDLE Recording Job 'J2' = ACTIVE

Annex B. Revision History

Rev.	Date	Editor	Changes
2.1	Jul-2011	Hans Busch	Split from Core 2.0 without change of content.
2.1.1	Jan-2012	Hans Busch	Change Requests 293, 297, 535
2.2	Apr-2012	Hans Busch	Change Requests 608, 625, 636, 673
2.2.1	Dec-2012	Hans Busch Michio Hirai	Change Requests 708, 709, 719, 759, 827, 845, 852, 866, 867, 870, 862, 872, 861
2.3	May-2013	Michio Hirai	Change Request 934
2.4	Aug-2013	Michio Hirai	Change Request 1073, 1086
2.4.1	Dec-2013	Michio Hirai	Change Request 1148, 1189
2.4.2	Jun-2014	Michio Hirai	Change Request 1292, 1298, 1304, 1412
2.5	Dec-2014	Hasan Timucin Ozdemir	Added 5.21 ExportRecordedData command and corresponding capability flag in 5.24 Capabilitites Added 5.22 StopExportRecordedData Added 5.23 GetExportRecordedDataStatus
