# 1 Scope

This document defines the ONVIF file format for exported media. The specification defines the mechanism necessary to support interoperable verification of the authenticity by the receiving party.

# 3 Terms and Definitions

## 3.1 Definitions

**Certificate** A certificate as used in this specification binds a public key to a subject entity. The certificate is digitally signed by the certificate issuer to allow for verifying its authenticity

**Signature** A digital signature or digital signature scheme is a mathematical scheme for demonstrating the authenticity of a digital message or document.

## 3.2 Abbreviations

| SHA | Secure Hashing Algorithm |

# 4 Overview

## 4.1 General

This specification extends the ISO/IEC 14496-12 Base File Format in order to serve Video Surveillance requirements.

## 4.2 Time Information

The ISO Base File Format has been mainly designed for storing movies and music clips. It defines a media timeline relative to the beginning which is defined as time zero. For Video Surveillance purposes it is important that the file includes the absolute start time of the captured frames. All other times can be derived using the relative time data defined in ISO/IEC 14496-12. Additional to this time information time corrections can be stored during the sealing process.

In order to improve random access the ISOM baseline requires the movie fragment table at the end of the file. This redundant information does not require the protection seal.

## 4.3 Location

Three mechanism for storing location information are defined for MP4 files by the mobile industry.

This specification refers to the ETSI standard which has defined means for textual and spherical representation using the so called 'loci' box.

Beside the ETSI standard two defacto standards exist for Android and iOS based mobile phones:

- Android phones use the '©xyz' box holding an alphanumeric string with lon and lat degrees.
- Mobile phones based on iOS store similar information in sub atoms of the meta box. Note that this meta box is incompatible with the ISO Base File Format specification.

The location information is designated to provide a best effort for the video location in order to be able to geo-locate the video. For fixed cameras the location should approximate to the intersection of the camera axis with the ground location. For moving cameras such an approach may not be feasible and a fallback to the camera location may be more suitable.

## 4.4 Sealing

All data that a user wishes to carry away separately are put into a metaphorical bag. The bag is then sealed to enable tamper detection. Anyone wanting to use the data from the bag first examines the seal. The data in the bag are identical with the original data as long as the seal is intact. Here, the metaphorical bag is represented by a file and the seal is represented by a signature over all data in the file.

The “bag of evidence” approach builds on procedures for media data and related metadata to be securely extracted from a trusted storage in a separate file. It defines which metadata has to be preserved in order to provide for accurate replay. Data are provided “as is” without any further assertions, whatsoever, to perpetuate evidence.

Processing power usage can be reduced by performing hash functions before signature algorithms are applied. Multiple stages of signatures might be applied to collect additional information into a single sealed file.

International state of the art standards are applied for the file structure, hash and signature algorithms. The surveillance application format and the RSA2048 signature defined by ISO/IEC as well as the SHA-256 hash algorithm approved by NIST come into operation for most widespread interoperability.

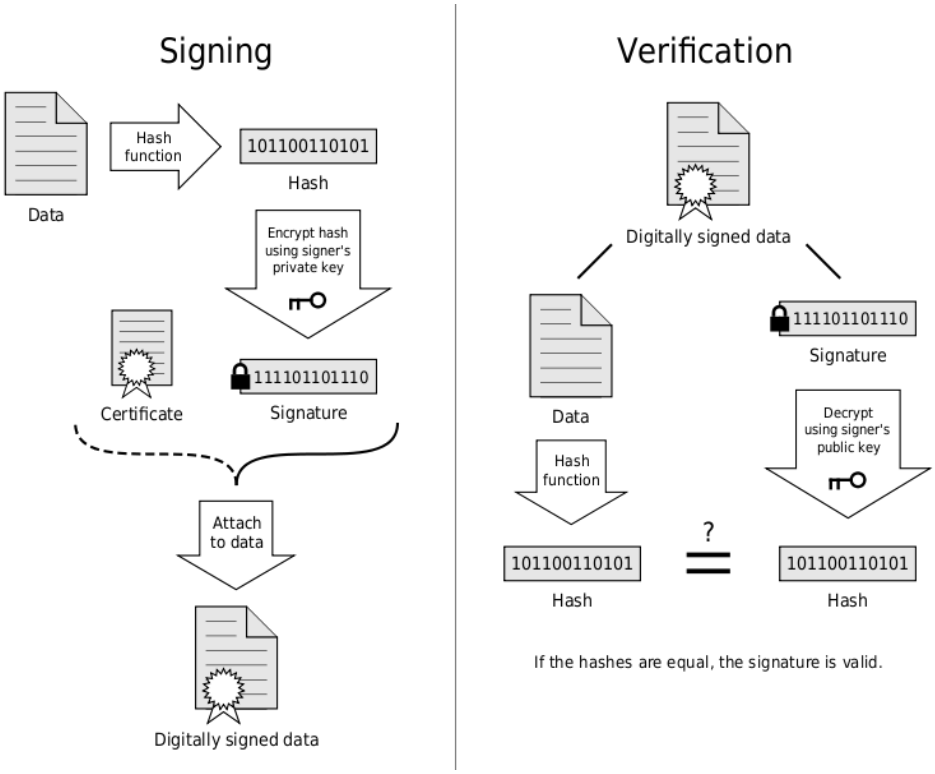

**Figure 1: Sealing and examination process in a nutshell (Source: Wikipedia)**

### 4.5 Use case 1: Playback of chunked and oversize clips at remote site

An operator exports a Video clip with associated Audio from a DVR of brand A onto two DVDs, because it didn't fit on one. The selected recording period contains gaps because the recorder did only record when motion is detected. The DVD is then sent to a second site with Software where the content of the DVDs is copied to the local hard disk. The user then plays it back in the Video Management System of brand B. The operator at the playback station wants to see the gaps in the recording and to seek to a time where Video has been exported. On playback he expects the Video to playback smoothly with lip sync Audio.

### 4.6 Use case 2: Forensic analysis at court

A court receives video clips from a grocery store, a street surveillance system and a metro operator. All three videos are shown in the court's approved video player.

The judges want to see the suspect in all three video clips with exact time information. They also want to have information when the video clips have been exported and whether the video sequence is complete and authentic.

### 4.7 Use case 3: Playback at players not equipped according to the present specification

An authorized person receives video clips in the format defined in the present specification and wants to play back the media data on players conforming to the underlying standards definitions. Interpretation of the additional information added by the present specification is not required.

## 5 Export Format

### 5.1 Requirements to Preserve Media Signing

In order to maintain the integrity and authenticity of ONVIF streaming media signed in accordance with the ONVIF Media Signing specification when exporting to an MP4 container, the following prerequisite steps shall

be adhered to during the export process to ensure signature verification remains intact and media evidence can be trusted as tamper-proof.

**Preserve NAL order and bytes**

ONVIF signed media bitstream captured from the device shall not be filtered, rewritten, re-encoded or normalized, as the raw format and order of NAL units is critical.

**Keep Media Signing SEI NAL units**

All SEI frames of type user data unregistered with UUID `005bc93f-2d71-5e95-ada4-796f90877a6f` shall not be stripped.

**Add Certificate SEI NAL unit if present**

The exported file should contain a certificate SEI at the beginning of a stream. This SEI includes all necessary information to validate subsequent SEIs.

## 5.2 Required Side Information

The SurveillanceExportBox is required. It is recommended that the SurveillanceExportBox be placed as early as possible in files, for maximum utility.

In order to be able to associate the recording with a camera/microphone and the exporting system the following information shall be placed in the box:

- Source – Description of the video source
    - Name – Name of the camera
    - URL – Address under which the camera can be accessed
    - MAC – Unique physical address of the camera (examples: 08-00-27-00-0C-15, 08:00:27:00:0C:15, 080027000C15)
    - Line – Input line number token for multi channel devices
- Source – Description of the audio source
    - Name – Name of the microphone
    - URL – Address under which the microphone can be accessed
    - MAC – Unique physical address of the microphone
- Export – Unit executing the export
    - Name – Name of the exporting unit
    - URL – Address under which the exporting unit can be accessed
    - MAC – Unique physical address of the exporting unit
    - Time – Date and time information as to when the export was executed (start time)
    - Operator – Name or identification of the operator performing the export

**SurveillanceExportBox**

```
Box Type:  ‘suep’
Container: Meta Box (‘meta’), file level
Mandatory: Yes
Quantity:  Exactly one
```

This box shall contain information for all available tracks.

**Syntax**

```
class SurveillanceExportBox
  extends  FullBox(‘suep’, version = 1, 0){
  string   ExportUnitName;
  string   ExportUnitURL;
  string   ExportUnitMAC;
  UInt(64)   ExportUnitTime;
  string   ExportOperator;
  UInt(32) entry_count;
  int i;
  for (i=0; i < entry_count; i++) {
    UInt(16)   TrackID;
    string   SourceName;
    string   SourceURL;
    string   SourceMAC;
    string   SourceLine;
  }
}
```

**Semantics**

String items are null-terminated strings in UTF-8 characters. If not applicable, the string shall contain the null-termination only.

`ExportOperator` is a string that gives the name or identification of the operator performing the export. This string may be empty.

`ExportUnitTime` is an integer that provides date and time designation as defined in ISO/IEC 14496-12 of when the export operation has been started.

`entry_count` is an integer that provides the number of tracks.

## 5.3 Timing

The box defined in the section shall be used to provide the start date and time of the capture. Subsequent signing instances may define corrected start times.

**StartTimeBox**

```
Box Types: 'cstb'
Container: Protection Scheme Information Box (‘sinf’) or Metadata box ('meta')
Mandatory: No
Quantity:  Zero or one
```

**Syntax**

```
aligned(8)
class CorrectStartTimeBox extends Box (‘cstb’) {
  UInt(32) entry_count;
  for (i=0; i < entry_count; i++) {
    unsigned int(32) track_ID;
    unsigned int(64) startTime;
  }
)
```

**Semantics**

**track_ID** An integer that provides a reference to a track in the presentation. track_IDs are never re-used and cannot be equal to zero.

**startTime** The UTC based time represented by the number of 100-nanosecond intervals since January 1, 1601 of the origin of the media timeline.

Note, typically it is sufficient to provide the start time for the first track only. Multiple entries e.g. allow to correct audio and video synchronization.

Each track fragment shall contain the Track Fragment Decode Time box ‘tfdt’ as defined in ISO/IEC 14496-12 to ease seeking during playback.

## 5.4 Location information

When available, the location of the camera view shall be provided as 'loci' box according to ETSI TS 126 244. See below informal repetition of the definition.

**Location Box**

```
Box Types: 'loci'
Container: User Data Box (‘udta’)
Mandatory: No
Quantity:  Zero or one
```

**Syntax**

```
aligned(8)
class  LocationInformationBox extends FullBox (‘loci’) {
  UInt(16) language;
  String Name;
  UInt(8) Role;
  UInt(32) Longitude;
  UInt(32) Latitude;
  UInt(32) Altitude;
  String AstronomicalBody;
  String Notes;
)
```

All characters of string based fields shall be encoded as UTF-8. The following semantics apply:

**Role** Shall be '1' - real location

**Name** Human readable street address of the location, optionally including building internal addressing.

**Longitude and Latitude** 16.16 bit fixed point angle in degree.

**Altitude** Height of the location in meter.

## 5.5 Timed metadata

ONVIF metadata supports transport of frame related scene description, events and PTZ information. This section defines how such information can be stored in export files.

ISO/IEC 14496-12 Base File Format defines the box requirements for timed XML metadata. This specification defines how to interpret the metx box.

```
aligned(8)
class XMLMetaDataSampleEntry() extends MetaDataSampleEntry (‘metx’) {
  string content_encoding; // optional
  string namespace;
  string schema_location; // optional
  BitRateBox(); // optional
)
```

**content_encoding** Defaults to 'xml'. Options defined by ONVIF are 'gzip' and 'exi'.

**namespace** For ONVIF compliant metadata this parameter shall be set to "http://www.onvif.org/ver10/schema".

**schema_location** Not used.

**BitRateBox** Not used.

An ONVIF compliant device shall describe a timed metadata track containing ONVIF metadata as defined by the ONVIF Streaming Specification using a XMLMetaDataSampleEntry box.

Content compression shall be signaled via the content_encoding field. See the ONVIF Streaming Specification for compression data format.

Note, XML documents should not be preceded by an XML declaration since both version and encoding are well defined.

## 5.6 Signature

### 5.6.1 Preparing the signature input

Inputs to the signature algorithm are all boxes of the file. These include boxes for signature creation, whose corresponding type is a string, set to a null value. The input contains signatures that are already present for repeated signing operations.

### 5.6.2 Generating the signature

Implementations of this specification shall support RSASSA-PSS signatures as specified in ISO/IEC 14888-2 and PKCS#1 v2.1 with:

- SHA-256 as specified in FIPS 180-4 as cryptographic hash function
- an RSA modulus length of at least 2048 bits
- MGF1 as specified in PKCS#1 v2.1 as mask generation algorithm with SHA-256 as cryptographic hash function
- Salt length 20
- Trailer field number as specified by the trailerFieldBC constant

Implementations may support other digital signature algorithms, if appropriate.

The generated signature string has to be included in the SignatureBox as defined in 5.6.3.

Generating and maintaining parameters of the signature algorithm, particularly signature and verification keys, is outside the scope of this document. Recommendations given, e.g., in FIPS 186 should be followed where appropriate.

### 5.6.3 Include the generated signature in the file

There are no changes to the file itself or the content after the signing operation has been performed. The sole exception is the input of the signature at the appropriate place.

The following box definitions provide for signature identification and inclusion. Encryption is not required; therefore an OriginalFormatBox is not necessary.

#### 5.6.3.1 Item Protection Box

`Box Type: 'ipro'`[1]

[1]Box definitions can be found in ISO/IEC 14496-12 Information technology -- Coding of audio-visual objects -- Part 12: ISO base media file format.

```
Container: Meta box (‘meta’)
Mandatory: Yes
Quantity:  Exactly one
```

The `protection_count` shall be 1.

### 5.6.3.2 Protection Scheme Info Box

```
Box Type: 'sinf'[2]
Container: Item Protection Box (‘ipro’)
Mandatory: Yes
Quantity:  One per signing instance
```

Contains exactly one SchemeTypeBox and exactly one SchemeInformationBox.

### 5.6.3.3 Scheme Type Box

```
Box Type: 'schm'[2]
Container: Protection Scheme Information Box (‘sinf’)
Mandatory: Yes
Quantity:  One per signing instance
```

The `scheme_type` shall be 0x6F656666 („**O**nvif **E**xport **F**ile **F**ormat#).

The `scheme_version` shall be 0x00010000 (version 1).

### 5.6.3.4 Scheme Information Box

```
Box Type: 'schi'[2]
Container: Protection Scheme Information Box (‘sinf’)
Mandatory: Yes
Quantity:  One per signing instance
```

Contains exactly one SignatureBoxand exactly one CertificateBox. May also contain exactly one AdditionalUserInformationBox, exactly one SignatureConfigurationBox, and one CorrectStartTimeBox[2].

### 5.6.3.5 Signature Box

```
Box Type: 'sibo'
Container: Scheme Information Box (‘schi’)
Mandatory: Yes
Quantity:  One per signing instance
```

#### Syntax

```
aligned(8) class SignatureBox
extends Box(‘sibo’) {bit(8)  signature[];}
```

#### Semantics

`signature` binary byte array. Length depends on used RSA key length.

### 5.6.3.6 Certificate Box

```
Box Type: 'cert'
Container: Scheme Information Box (‘schi’)
Mandatory: Yes
```

[2]CorrectStartTimeBox was added in version 1.1 of the ONVIF Export File Format

```
Quantity:  One per signing instance
```

**Syntax**

```
aligned(8) class CertificateBox
extends Box('cert') {
bit(8) data[];
}
```

**Semantics**

data is the DER encoded binary byte array representation of the certificate for the key that should be used to verify the signature in the SignatureBox

#### 5.6.3.7 Signature Configuration Box

```
Box Type: 'sigC'
Container: Scheme Information Box ('schi')
Mandatory: No
Quantity:  Zero or one per signing instance
```

**Syntax**

```
aligned(8)
class SignatureConfigurationBox
  extends Box('sigC') {
    bit(8)AlgorithmIdentifier[];
  }
```

**Semantics**

The 'sigC' box shall be present when the signature algorithm deviates from the default defined in 5.6.2. Its AlgorithmIdentifier is the signature algorithm identifier with optional parameters as defined by RFC 3280 and RFC 4055. It is encoded using the ASN.1 distinguished encoding rules (DER) and has the structure:

:AlgorithmIdentifier ::= SEQUENCE {

```
algorithm               OBJECT IDENTIFIER,
parameters              ANY DEFINED BY algorithm OPTIONAL
}
```

### 5.7 Repeated signing

#### 5.7.1 Procedure

To add an item, for example, electronic receiving stamps, repeated signing of the file may be required.

Repeat steps defined in 5.6.1 and 5.6.2 and append another ProtectionSchemeInfoBox at the foot of the list of already existing boxes of that type as defined in 5.6.3 while not changing `protection_count` in the ItemProtectionBox. Parsers are required to check for the existence of multiple ProtectionSchemeInfoBox despite `protection_count` is fixed to 1, because any change of content which has already been signed would render the appropriate signature invalid. An optional AdditionalUserInformationBox might be used in order to add information.

In order to include optional user information, data related to an additional signature 'auib' box is provided.

#### 5.7.2 Additional User Information Box

```
Box Type: 'auib'
Container: Scheme Information Box ('schi')
```

```
Mandatory: No
Quantity:  Zero or one per signing instance
```

### Syntax

```
aligned(8)
class AdditionalUserInformationBox
  extends Box('auib') {
    string  UserInformation;
  }
```

### Semantics

`UserInformation` is a null terminated string in UTF-8 characters

# Annex A.
# Repeated Signing (informative)

Figure A.1 characterizes the box arrangement defined in the present specification for data export.

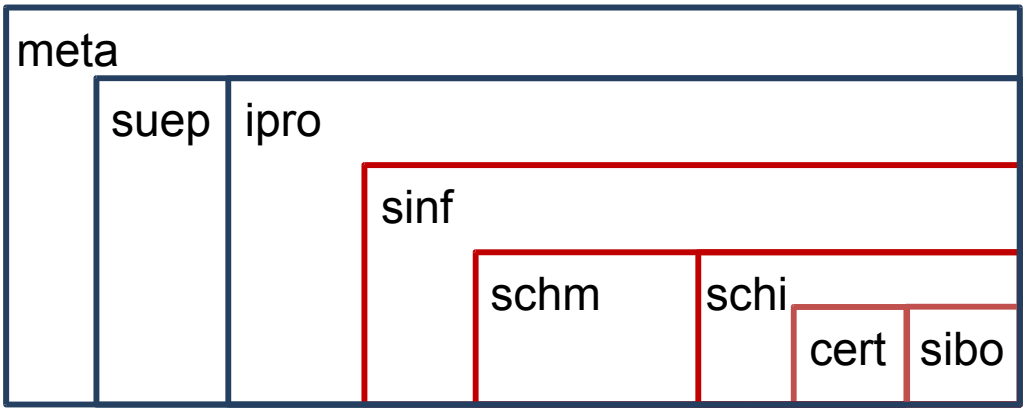

**Figure A.1: Box structure with single signature**

Figure A.2 characterizes the box arrangement after repeated signing.

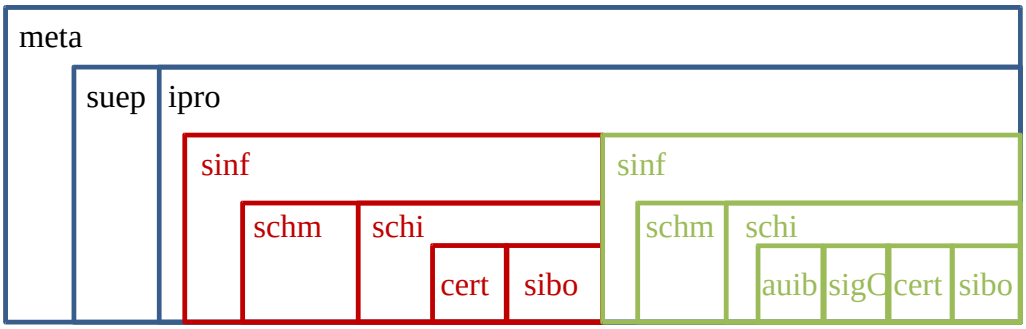

**Figure A.2: Box structure with double signature**

The red color represents the signature introduced at the export stage. The green color represents another signing operation happening after the export stage. The CertificateBox provides the public key for signature verification. Within the SignatureConfigurationBox information is contained describing a nondefault signature algorithm and its parameters. Additional information has been added in the AdditionalUserInformationBox.

In order to check validity of a signature the signature itself has to be taken from the SignatureBox and the bit values for the signature string be set to zero. The hashing operation is performed followed by the signature operation on the hash value. Now the two signatures can be compared.

Example: Steps to check validity of the first (red) signature from above

- Remove the (green) boxes created for the second signing
- Re-adjust box sizes of ‘ipro’ and ‘meta’ according to the size of removed ‘sinf’ box
- Read the public key from the red CertificateBox (do not change the box content)
- Take out the signature from the red SignatureBox
- Set the bit values of the red SignatureBox to zero

- Perform hash operation on the remaining file data
- Perform signature operation on the obtained hash value
- Compare the just generated signature with the signature taken out before

# Annex B.
# Box Structure (informative)

The diagram below provides an overview on required boxes and their referencing for a video stream with audio and timed metadata. In order to simplify the example, it shows the content of a single fragment while a real file would contain numerous fragments.

```
ftyp[1]                     File brand ‘isom’.
moov[1]                     File wide definitions
    mvhd[1]                 Movie header with creation time, timescale, duration and others
    trak[1]                 First track is expected to contain Video
        tkhd[1]             Track header with creation time, timescale, duration, track ID
        mdia[1]
            mdhd[1]         Media header with creation time, timescale, duration and others
            hdlr[1]         Signals that this is a Video track (type is 'vide')
            minf[1]         Contains creation time, timescale, duration and others
                vmhd[1]     Video color information
                dinf[1]     Data location information.
                dref[1]
                    url[1]  Data location flag in file must be set
            stbl[1]         Container with sample descriptions.
                stsd[1]     Codec information
                     avc1[1] H.264 codec information
                stts[1]     Sample index by time
                stsc[1]     Sample to chunk mapping
                stco[1]     List of Chunk offsets inside 'mdat' relative to file begin

    trak[1]                 Second track with Audio
        tkhd[1]             Track header with creation time, timescale, duration, track ID
        mdia[1]
            mdhd[1]         Media header with creation time, timescale, duration and others
            hdlr[1]         Signals that this is a Audio track (type is 'soun')
            minf[1]         Contains creation time, timescale, duration and others
                mhd[1]      Audio stereo balance information
                dinf[1]     Data location information.
                dref[1]
                    url[1]  Data location flag in file must be set
            stbl[1]         Container with sample descriptions.
                stsd[1]     Codec information
                    mp4a[1] Audio format information
                stts[1]     Sample index by time
                stsc[1]     Sample to chunk mapping
                stco[1]     List of Chunk offsets inside 'mdat' relative to file begin
    udta[1]                 User data
        loci[3]             Geo location information
    trak[1]                 Third track with timed metadata
        tkhd[1]             Track header with creation time, timescale, duration, track ID
        mdia[1]
            mdhd[1]         Media header with creation time, timescale, duration and others
            hdlr[1]         Signals that this is a metadata track (type is 'meta')
            minf[1]         Contains creation time, timescale, duration and others
                nmhd[1]     Null media handler box
                dinf[1]     Data location information.
                dref[1]
                    url[1]  Data location flag in file must be set
            stbl[1]         Container with sample descriptions.
                stsd[1]     Codec information
                    metx[1] Metadata format information
                stts[1]     Sample index by time
                stsc[1]     Sample to chunk mapping
```

```
                stco[1]         List of Chunk offsets inside 'mdat' relative to file begin
mdat[1]                         Raw Video and Audio of first fragment (moov)
moof[1]                         Fragment
    mfhd[1]                     Contains creation time, timescale, duration and others
    traf[1]                     First track with Video
        tfhd[1]                 Sample information
        tfdt[1]                 Track fragment decode time
        trun[1]                 Access to raw data in mdat box
    traf[1]                     Second track with Audio
        tfhd[1]                 Sample information
        tfdt[1]                 Track fragment decode time
        trun[1]                 Access to raw data in mdat box
    traf[1]                     Third track with timed metadata
        tfhd[1]                 Sample information
        tfdt[1]                 Track fragment decode time
        trun[1]                 Access to raw data in mdat box
mdat[1]                         Raw Video and Audio of this
meta[1]                         File level meta information
    hdlr[1]
    suep[2]                     Export supplementary information
    ipro[1]                     File protection
        sinf[1]                 File protection  information
            cstb[2]             Start time

# Annex C.
# Media Signing Recommendations

**No re-encoding**

ONVIF signed media stream captured from the device shall not be transcoded or recompressed. Instead, use pure remuxing (`-c copy` in ffmpeg) to change containers.

**Treat the video elementary stream as immutable**

- Keep all SPS/PPS/VPS, access unit delimiter (AUD), prefix/suffix SEI and slice NALs in their original order.
- Do not change frame rate, timescale, timebase or GOP structure. Avoid frame duplication, dropping, de-interlacing or timestamp “cleanup”.
- For SEI preservation: In H.264 the SEI NAL type is 6; in HEVC, SEI prefix/suffix types are 39/40. These must stay attached to the same access units they originally accompanied. Do not convert or regroup SEIs (e.g., never swap HEVC prefix and suffix).
- Avoid bitstream filters. Only use a filter when absolutely certain it will not modify or remove SEIs. Never run “cleaning” filters that remove private SEIs.

Validate before and after File Export. Run Media Signing validation on the original source and again on the exported MP4 to confirm integrity.

A simpler test is to only verify that the MP4 file has SEIs present after export. Below is an ffmpeg command for that.

```
ffmpeg -i outSigned.mp4 -c copy -bsf:v trace_headers -f null - 2>&1 | grep -i sei
```

**Cut at signature-safe boundaries**

Trim at SEIs. There will always be a "dangling end" of the exported file, that is, frames that cannot be validated since the associated SEI is not present in the exported recording. To minimize the "dangling end", trim at frames with a signed SEI (inclusive), that is, a SEI with a signature.

# Annex D.
# Revision History

| Rev. | Date | Editor | Changes |
|---|---|---|---|
| 1.0 | March 2013 | Gero Bäse | First release |
| 1.0.1 | May-2014 | Michio Hirai | Change Request 1330 |
| 17.06 | Jun-2017 | Hans Busch, Hiroyuki Sano | Change Request 1843 Change Request 2065 |
| 18.06 | Jun-2017 | Stefan Andersson, Hans Busch | Add cstb box Add suep version 1 and Annex B |
| 18.12 | Dec-2018 | Hiroyuki Sano | Change Request 2299, 2356, 2358, 2359, 2383, 2405 |
| 21.06 | Jun-2021 | Hans Busch | Move sigC definition to 5.4. Remove obsolete UUID notion. |
| 21.12 | Dec-2021 | Hans Busch | Add timed metadata. |
| 22.06 | Jun-2022 | Hans Busch | Add location information. |
| 22.12 | Dec-2022 | Hans Busch | Remove references to ISO 23000-10. Add support for cstb in meta to support cases without signing. |
| 24.12 | Dec-2024 | Sriram Bhetanabottla | Update ISO reference link. |
| 26.06 | Jun-2026 | Sriram Bhetanabottla, Björn Völcker, Hans Busch | Add support for ONVIF Media Signing specifications. |
