1 Scope

This document defines the web service interface for searching for recorded Video, Audio and Metadata.

For a definition of the storage model see the ONVIF Recording Control Specification.

Web service usage is outside of the scope of this document. Please refer to the ONVIF core specification.

2 Normative references

ONVIF Core Specification

ONVIF Recording Control Specification

3 Terms and Definitions

3.1 Definitions

Metadata All streaming data except video and audio, including video analytics results, PTZ position data and other metadata (such as textual data from POS applications).

Recording A container for a set of audio, video and metadata tracks. A recording can hold one or more tracks. A track is viewed as an infinite timeline that holds data at certain times.

Recording Event An event associated with a Recording, represented by a notification message in the APIs

Recording Job A job performs the transfer of data from a data source to a particular recording using a particular configuration

Track An individual data channel consisting of video, audio, or metadata. This definition is consistent with the definition of track in [RFC 2326]

Video Analytics Algorithms or programs used to analyze video data and to generate data describing object location and behaviour.

3.2 Abbreviations

ONVIF Open Network Video Interface Forum
4 Overview

The search service enables a client to find information about the recordings on the storage device, for example to construct a “timeline” view, and to find data of interest within a set of recordings. The latter is achieved by searching for events and other information that is included in the metadata track recording.

The search service provides the following functionality:

- Find recordings and information about each recording
- Find events in the metadata and among the historical events
- Find PTZ positions in the metadata
- Find other information in the metadata e.g. text from EPOS (electronic point-of-sale) systems

The actual searching is done by coupled find and result operations and is asynchronous. Each find operation initiates a search session. The client can then acquire the results from the search session in increments, or all at once, depending on implementation and the scale of the search. There are four pairs of search operations for recordings, recording events, PTZ positions and metadata.

FindRecordings and GetRecordingSearchResults
FindEvents and GetEventSearchResults
FindPTZPosition and GetPTZPositionSearchResults
FindMetadata and GetMetadataSearchResults

WSDL for this service is specified in http://www.onvif.org/ver10/search.wsdl.

5 Service

5.1 Introduction

The search service provides a number of operations for finding data of interest within a set of recordings. The most common way of doing this would be to search for events that are either
included in the metadata track of a recording, or are otherwise associated with a recording in
the device (see Recording Events below).

GetRecordingSummary returns a summary for all recording, and can be used to provide the
scale of a timeline.

GetRecordingInformation returns information about a single recording, such as start time and
current status.

GetMediaAttributes returns the media attributes of a recording at a specific point in time.

The actual search is done by coupled find and result operations. Each find operation initiates
a search session. The client can then acquire the results from the search session in
increments, or all at once, depending on implementation and the scale of the search. There
are four pairs of search operations for Recordings, Recording Events, PTZ Positions and
Metadata.

GetSearchState returns the state of a search session.

EndSearch ends a search session, halting search and returning any blocking result operations.

5.2 Concepts

5.2.1 Search Direction

Search is performed from a start point on the time line, towards an end point. If the end point
is prior to the start point, search will be performed backwards. This can be useful if only the
newest matching event is of interest, or if it is otherwise convenient to get the results in
newest to oldest order.

If no end point is specified, the search will always be performed forward in time from the start
point.

5.2.2 Recording Event

Describes a discrete event related to the recording. It is represented as a notification
message, but this does not necessarily mean it has been recorded as a notification.
Recording events can either be notifications included in a recorded metadata track, it can be
created by the recording device as a result of an internal event or mechanism, or it can be
inserted by a client using a WebService request or a metadata stream. However the recording
event has been created and associated with a particular recording, this specification makes
no implications on how it is stored internally on a device, only how it should be represented in
the interface.

However created, recording events are always treated as notifications in regards to search
filters and results returned. Each recording event has a notification topic as defined in the
Topic Structure section of the ONVIF Core Specification. Predefined recording events are
described in section 5.19.

To communicate the original state of property events, virtual start state events can be
returned in a search result containing the value of one or more properties at the start point of
the search interval. Such start state events are virtual events in the sense that they are
created on the fly by the server, rather than being collected from recorded data. If the client
indicates that such events are desired by setting the appropriate flag, virtual events matching
the topics defined in the search filter shall be returned for any recording in the search scope.
5.2.3  Search Session

A search session is started asynchronously by a Find-operation and is identified by a search
token unique for that session. Results are returned in increments using GetResult-operations
referring to the session created by the Find-operation. The search can be terminated in three
ways:

- KeepAlive time expires – If no request from a client has been made that refers to a
  particular session within the specified time interval, it will terminate.

- A GetResult method returns the last data for the search session by setting the search
  state in its result to “Completed”.

- EndSearch – The client explicitly ends a session.

Ending a session will cancel an ongoing search, immediately return and make further
requests to the same session result in an error message. A device shall not reuse search
token immediately as it would confuse clients unaware that a session had ended.

5.2.4  Search Scope

The scope contains a number of optional elements, together limiting the set of data to look
into when performing searches.

5.2.4.1  Included data

Optionally, the client can define sources and recordings to search in by specifying lists of
tokens for each type. If several types are given, the union of the specified tokens shall be
used. If there are no sources or recordings tokens specified, all recordings shall be included.
The scope is further refined by the Recording Information Filter. However, if recordings are
specified the filters will only be applied to that subset of recordings.

5.2.4.2  Recording Information Filter

Rather than specifying a list of recording tokens, the recordings can be filtered by an Xpath
filter operating on the RecordingInformation structure. This allows the client to filter on all
elements present in the RecordingInformation structure, using comparisons according to the
Xpath dialect defined in section 5.20. If a recording information filter is supplied, only
recordings matching the filter shall be part of the scope.

Example of a filter that includes only recordings containing audio in the search scope:

    boolean(//Track[TrackType = "Audio"])

5.2.5  Search Filters

Search filters are specific for the type of search operation. See FindEvents, FindPTZPosition,
FindMetadata respectively. They all act on the recordings defined by the scope.

5.2.6  Time Information

An ONVIF compliant device shall support time values in request parameters that are given in
utc with the 'Z' indicator and respond all time values as utc including the 'Z' indicator.
5.3 Data Structures

5.3.1 RecordingInformation Structure

RecordingInformation contains information about a recording, the tracks it consists of and the source.

- RecordingToken – a unique identifier of the recording.
- EarliestRecording – the date and time of the oldest data in the recording.
- LatestRecording – the date and time of the newest data in the recording.
- Content – informative description of content. If the content is unknown this field is empty.
- RecordingStatus – current status of recording, can be any of: Initiated, Recording, Stopped, Removing, Removed, Unknown.
- RecordingSourceInformation – a structure containing information about the source of the recording.
- TrackInformation – a list of track information structures.

![Figure 1: Recording state chart.](image)

Figure 1 shows the state changes for the RecordingStatus. The following adds additional explanation:

- Initiated – the new recording is created and the specified recording has not yet started to record.
- Recording – the recording job is executing the specified recording.
- Stopped – the recording job is pausing the specified recording. This case requires that the job has started recording before at least once.
- Removing : The specified recording is in the process of being deleted.
- Removed : The specified recording has been removed.
• Unknown : This case should never happen.

5.3.2 RecordingSourceInformation Structure

Contains information about the source of a recording.

• SourceId – an identifier for the source chosen by the client that creates the recording. This identifier is opaque to the device. Clients may use any type of URI for this field. If this identifier is not present this field is empty.

• Name – informative name of the source. If the name is unknown this field is empty.

• Location – informative description of the location of the source. If the description is not available this string is empty.

• Description – informative description of the source. If this description is not present, the description is empty.

• Address – informative URI of the source.

5.3.3 TrackInformation Structure

Contains information about a single track in a recording. Note that a track may represent a single contiguous time span or consist of multiple slices as shown in the introduction of the ONVIF Recording Control Specification. If there is no recorded data for a track the TrackInformation shall not be provided.

• TrackToken – an identifier of the track. The TrackToken is unique between all TrackTokens used within a recording.

• TrackType – identifies the type of track (video, audio or metadata)

• Description – informative description of the track. If this information is not present, this field is empty.

• DataFrom – The start date and time of the oldest recorded data in the track.

• DataTo – The stop date and time of the newest recorded data in the track.

5.3.4 SearchState Enumeration

The search state can be one of the following

• Searching – The database search is in progress and there may be results available that can be fetched via the method GetEventSearchResults.

• Completed – Search has been completed and all results have been delivered via GetEventSearchResults.

The usage of the additionally defined state "Queued" is deprecated.

5.3.5 MediaAttributes Structure

The MediaAttributes contains information about the media tracks of a particular recording for a particular time frame. The time frame can be a single point in time, in which case the From and Until elements are identical.

• RecordingToken – A reference to the recording that this structure concerns.
• From – a point in time from when the attributes are valid for the recording.
• Until – a point in time until when the specified attributes are valid for the recording.
• VideoAttributes - A set of video attributes, describing the data of a recorded video track.
• AudioAttributes - A set of audio attributes, describing the data of a recorded audio track.
• MetadataAttributes - A set of attributes, describing the possible metadata content of a recorded metadata track.

5.3.6 FindEventResult Structure
• RecordingToken – identifying the recording containing the found event.
• TrackToken – identifying the track containing the found event.
• Time – the date and time of the found event.
• Event – the event message found.
• StartStateEvent – if true, indicates the event represents the start state of one or more properties in the recording.

5.3.7 FindPTZPositionResult Structure
• RecordingToken – identifying the recording containing the matching position.
• TrackToken – identifying the track containing the matching position.
• Time – the date and time of the matching position.
• Position – the matching PTZ vector.

5.3.8 PTZPositionFilter Structure
Contains the necessary elements to define what PTZ positions to search for. The PTZ vectors shall be in the same coordinate space as the PTZ coordinates stored in the recording.

• MinPosition - The lower boundary of the PTZ volume to look for.
• MaxPosition - The upper boundary of the PTZ volume to look for.
• EnterOrExit - If true, report the positions when entering or exiting the specified PTZ volume. Otherwise report all recorded positions within the specified PTZ range.

5.3.9 MetadataFilter Structure
Contains an Xpath expression to be applied to the MetadataStream structure.

Example of an expression searching for objects overlapping the lower right quadrant of the scene:

```xml
boolean(//Object/Appearance/Shape/BoundingBox[@right > "0.5"]) and
boolean(//Object/Appearance/Shape/BoundingBox[@bottom > "0.5"])
```

5.3.10 FindMetadataResult Structure
• RecordingToken – identifying the recording containing the matching metadata.
- TrackToken – identifying the track containing the matching metadata.
- Time – the date and time of the matching metadata.

5.4 GetRecordingSummary

GetRecordingSummary is used to get a summary description of all recorded data. This operation is mandatory to support for a device implementing the recording search service.

Table 2: GetRecordingSummary command

<table>
<thead>
<tr>
<th>GetRecordingSummary</th>
<th>Access Class: READ_MEDIA</th>
</tr>
</thead>
<tbody>
<tr>
<td>Message name</td>
<td>Description</td>
</tr>
<tr>

<td>tt:RecordingInformation RecordingInformation[1][1]</td>
</tr>
</tbody>
</table>

Fault codes | Description
--- | ---
env:Sender | The RecordingToken is not valid.
env:Sender:InvalidArgVal | The RecordingToken is not valid.
5.6 GetMediaAttributes

Returns a set of media attributes for all tracks of the specified recordings at a specified point in time. Clients using this operation shall be able to use it as a non-blocking operation. A device shall set the start time and end time of the MediaAttributes structure to equal values if calculating this range would cause the operation to block. See MediaAttributes structure for more information. This operation is mandatory to support for a device implementing the recording search service.

Devices indicating CanContainPTZ shall report the PTZ spaces in use at the specified point in time (including generic spaces). For optimal interoperability device implementations should use generic spaces. Generic spaces are http://www.onvif.org/ver10/tptz/PanTiltSpaces/PositionGenericSpace and http://www.onvif.org/ver10/tptz/ZoomSpaces/PositionGenericSpace.

Table 4: GetMediaAttributes command

<table>
<thead>
<tr>

</tr>
<tr>
<td>env:Sender:InvalidToken</td>
<td>No recording available.</td>
</tr>
</tbody>
</table>

5.7 FindRecordings

FindRecordings starts a search session, looking for recordings that matches the scope (See 5.2.4) defined in the request. Results from the search are acquired using the GetRecordingSearchResults request, specifying the search token returned from this request.

The device shall continue searching until one of the following occurs:

- The total number of matches has been found, defined by the MaxMatches parameter.
- The session has been ended by a client EndSearch request.
- The session has been ended because KeepAliveTime since the last request related to this session has expired.
The order of the results is undefined, to allow the device to return results in any order they are found. This operation is mandatory to support for a device implementing the recording search service.

For the KeepAliveTime a device shall support at least values up to ten seconds. A device may adapt larger values.

Table 5: FindRecordings command

<table>
<thead>
<tr>

</thead>
<tbody>
<tr>
<td>env:Receiver</td>
<td>Device is unable to create a new search session.</td>
</tr>
<tr>
<td>env:Sender</td>
<td>The recording source is invalid.</td>
</tr>
</tbody>
</table>

5.8 GetRecordingSearchResults

GetRecordingSearchResults acquires the results from a recording search session previously initiated by a FindRecordings operation. The response shall not include results already returned in previous requests for the same session. If MaxResults is specified, the response shall not contain more than MaxResults results. The number of results relates to the number of recordings. For viewing individual recorded data for a signal track use the FindEvents method.

GetRecordingSearchResults shall block until:

- MaxResults results are available for the response if MaxResults is specified.
- MinResults results are available for the response if MinResults is specified.
- WaitTime has expired.
- Search is completed or stopped.

This operation is mandatory to support for a device implementing the recording search service. If any of the specified parameters MinResults and WaitTime exceed the supported range a device shall adapt them instead of responding an error.
Table 6: GetRecordingSearchResults command

<table>
<thead>
<tr>
<th>Message name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GetRecordingSearchResults Request</td>
<td>SearchToken specifies the search session. MinResults specifies the minimum number of results that should be returned. If the total number of results is lower than MinResults in a completed search, all results should be returned. MaxResults specifies the maximum number of results to return. WaitTime defines the maximum time to block, waiting for results.</td>
</tr>
<tr>

</tr>
</thead>
<tbody>
<tr>
<td>ter:InvalidArgVal</td>
<td>The search token is invalid.</td>
</tr>
<tr>
<td>ter:InvalidToken</td>
<td>The search token is invalid.</td>
</tr>
</tbody>
</table>

5.9 FindEvents

FindEvents starts a search session, looking for events in the scope (See 5.2.4) that match the search filter defined in the request. Events are recording events (see 5.2.2) and other events that are available in the track. Results from the search are acquired using the GetEventSearchResults request, specifying the search token returned from this request.

The device shall continue searching until one of the following occurs:

- The entire time range from StartPoint to EndPoint has been searched through.
- The total number of matches has been found, defined by the MaxMatches parameter.
- The session has been ended by a client EndSearch request.
- The session has been ended because KeepAliveTime since the last request related to this session has expired.

Results shall be ordered by time, ascending in case of forward search, or descending in case of backward search. This operation is mandatory to support for a device implementing the recording search service. Although the values of property events refer to the forward direction, they shall be reported identically in reverse search mode.

For the KeepAliveTime a device shall support at least values up to ten seconds. A device may adapt larger values.
Table 7: FindEvents command

<table>
<thead>
<tr>
<th>Message name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FindEventsRequest</td>
<td>StartPoint is the point of time where the search will start. EndPoint is the point of time where the search will stop. This can be a time before the StartPoint, in which case the search is performed backwards in time. If EndPoint is omitted, search will go forward from the StartPoint. Scope defines the dataset to consider for this search. SearchFilter contains the topic and message filter needed to define what events to search for. By setting the IncludeStartState to true, the client indicates that virtual events at the time of StartPoint should be returned to represent the state in the recording. In case of a backward search, virtual events at the time of EndPoint and StartPoint should be returned. Support for virtual events is mandatory for recording events. Support for additional virtual events is signaled via the GeneralStartEvents capability. The search ends after MaxMatches. KeepAliveTime is the session timeout after each request concerning this session.</td>
</tr>

</tbody>
</table>

5.10 GetEventSearchResults

GetEventSearchResults acquires the results from a recording event search session previously initiated by a FindEvents operation. The response shall not include results already returned in previous requests for the same session. If MaxResults is specified, the response shall not contain more than MaxResults results.

GetEventSearchResults shall block until:

- **MaxResults** results are available for the response if MaxResults is specified.
- **MinResults** results are available for the response if MinResults is specified.
- **WaitTime** has expired.
- Search is completed or stopped.
This operation is mandatory to support for a device implementing the recording search service. If any of the specified parameters MinResults and WaitTime exceed the supported range a device shall adapt them instead of responding an error.

Table 8: GetEventSearchResults command

<table>

5.11 FindPTZPosition

FindPTZPosition starts a search session, looking for ptz positions in the scope (See 5.2.4) that matches the search filter defined in the request. Results from the search are acquired using the GetPTZPositionSearchResults request, specifying the search token returned from this request.

The device shall continue searching until one of the following occurs:

- The entire time range from StartPoint to EndPoint has been searched through.
- The total number of matches has been found, defined by the MaxMatches parameter.
- The session has been ended by a client EndSearch request.
- The session has been ended because KeepAliveTime since the last request related to this session has expired.

This operation is mandatory to support whenever CanContainPTZ is true for any metadata track in any recording on the device.

For the KeepAliveTime a device shall support at least values up to ten seconds. A device may adapt larger values.

A device shall only match the search criteria against PTZ status updates available between the time interval given in the search, i.e. the device shall not locate the PTZ position at the start of the search interval.

### 5.12 GetPTZPositionSearchResults

GetPTZPositionSearchResults acquires the results from a PTZ position search session previously initiated by a FindPTZPosition operation. The response shall not include results already returned in previous requests for the same session. If MaxResults is specified, the response shall not contain more than MaxResults results.

GetPTZPositionSearchResults shall block until:

- **MaxResults** results are available for the response if MaxResults is specified.
- **MinResults** results are available for the response if MinResults is specified.
- **WaitTime** has expired.
- Search is completed or stopped.

This operation is mandatory to support whenever CanContainPTZ is true for any metadata track in any recording on the device. If any of the specified parameters MinResults and WaitTime exceed the supported range a device shall adapt them instead of responding an error.

5.13 FindMetadata

FindMetadata starts a search session, looking for metadata in the scope (See 5.2.4) that matches the search filter defined in the request. Results from the search are acquired using the GetMetadataSearchResults request, specifying the search token returned from this request.

The device shall continue searching until one of the following occurs:

- The entire time range from StartPoint to EndPoint has been searched through.
- The total number of matches has been found, defined by the MaxMatches parameter.
- The session has been ended by a client EndSearch request.
- The session has been ended because KeepAliveTime since the last request related to this session has expired.

This operation is mandatory to support if the MetaDataSearch capability is set to true in the SearchCapabilities structure return by the GetCapabilities command in the Device service.

For the KeepAliveTime a device shall support at least values up to ten seconds. A device may adapt larger values.
Table 11: FindMetadata command

<table>
<thead>
<tr>
<th>Message name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FindMetadataRequest</td>
<td><strong>StartPoint</strong> is the point of time where the search will start. <strong>EndPoint</strong> is the point of time where the search will stop. This can be a time before the StartPoint, in which case the search is performed backwards in time. If EndPoint is omitted, search will go forward from the StartPoint. Scope defines the dataset to consider for this search. SearchFilter contains the search criteria needed to define the metadata to search for. The search ends after MaxMatches. KeepAliveTime is the session timeout after each request concerning this session.</td>
</tr>
<tr>

</tr>
</tbody>
</table>

#### 5.14 GetMetadataSearchResults

GetMetadataSearchResults acquires the results from a recording search session previously initiated by a FindMetadata operation. The response shall not include results already returned in previous requests for the same session. If **MaxResults** is specified, the response shall not contain more than **MaxResults** results.

GetMetadataSearchResults shall block until:

- **MaxResults** results are available for the response if **MaxResults** is specified.
- **MinResults** results are available for the response if **MinResults** is specified.
- **WaitTime** has expired.
- Search is completed or stopped.

This operation is mandatory to support if the MetaDataSearch capability is set to true in the SearchCapabilities structure return by the GetCapabilities command in the Device service. If any of the specified parameters MinResults and WaitTime exceed the supported range a device shall adapt them instead of responding an error.

Table 12: GetMetadataSearchResults command

| GetMetadataSearchResults | Access Class: READ_MEDIA |
### GetMetadataSearchResultsRequest

**Message name**

GetMetadataSearchResultsRequest

**Description**

SearchToken specifies the search session. MinResults specifies the minimum number of results that should be returned. MaxResults specifies the maximum number of results to return. WaitTime defines the maximum time to block, waiting for results.

**Fields:**
- `Tt:JobToken SearchToken[1][1]`
- `xs:int MinResults[0][1]`
- `xs:int MaxResults[0][1]`
- `xs:duration WaitFor[0][1]`

### GetMetadataSearchResultsResponse

**Message name**

GetMetadataSearchResultsResponse

**Description**

Returns a structure containing the current SearchState and a list of FindMetadataResult structures.

**Fields:**
- `Tt:SearchState SearchState[1][1]`
- `tt:FindMetadataResult FindMetadataResult[0][unbounded]`

### Fault codes

**Description**

- `env:Sender` invalidArgVal
- `error:InvalidToken`

The search token is invalid.

#### 5.15 GetSearchState

GetSearchState returns the current state of the specified search session.

This command is deprecated.

**Table 13: GetSearchState command**

<table>
<thead>
<tr>
<th>Message name</th>
<th>Access Class: READ_MEDIA</th>
</tr>
</thead>
<tbody>
<tr>
<td>GetSearchStateRequest</td>
<td></td>
</tr>
</tbody>
</table>

**Message name**

GetSearchStateRequest

**Description**

`SearchToken specifies the search session.`

**Fields:**
- `Tt:JobToken SearchToken[1][1]`

### GetSearchStateResponse

**Message name**

GetSearchStateResponse

**Description**

Returns the current state of the search session.

**Fields:**
- `Tt:SearchState State[1][1]`

### Fault codes

**Description**

- `env:Sender` invalidArgVal
- `error:InvalidToken`

The search token is invalid.

#### 5.16 EndSearch

EndSearch stops an ongoing search session, causing any blocking result request to return and the SearchToken to become invalid. If the search was interrupted before completion, the point in time that the search had reached shall be returned. If the search had not yet begun, the StartPoint shall be returned. Note that an error message will occur if the search session has already completed before this request. If the search was completed the original EndPoint supplied by the Find operation shall be returned. When issuing EndSearch on a FindRecordings request the EndPoint is undefined and shall not be used since the FindRecordings request doesn't have StartPoint/EndPoint. This operation is mandatory to support for a device implementing the recording search service.
Table 14: EndSearch command

<table>
<thead>
<tr>
<th>Message name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EndSearchRequest</td>
<td>SearchToken specifies the search session.</td>
</tr>
<tr>
<td></td>
<td>Tt:JobToken SearchToken</td>
</tr>
<tr>

</tr>
</tbody>
</table>

Fault codes

<table>
<thead>
<tr>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>env:Sender:InvalidArgVal</td>
</tr>
<tr>
<td>ter:InvalidToken</td>
</tr>
</tbody>
</table>

The search token is invalid.

5.17 Capabilities

The capabilities reflect optional functions and functionality of a service. The information is static and does not change during device operation. The following capabilities are available:

MetadataSearch Indication if the device supports generic search of recorded metadata,

GeneralStartEvents Indicates support for general virtual property events in the FindEvents method

Table 15: GetServiceCapabilities command

<table>

</tr>
</tbody>
</table>

### 5.19 Recording Event Descriptions

A device shall generate the following events with the corresponding event message descriptions. A device supporting the recording search service shall record these notification messages so that clients can use FindEvents to search for these messages. All recording events that are generated by the device and inserted into the recording history shall have a root topic of tns1:RecordingHistory.

The time of all recording events shall specify the actual time relating to recording regardless of the sending time of the event.

**Topic:** tns1:RecordingHistory/Recording/State

```xml
<tt:MessageDescription IsProperty="true">
  <tt:Source>
    <tt:SimpleItemDescription Name="RecordingToken" Type="tt:ReferenceToken"/>
  </tt:Source>
  <tt:Data>
    <tt:SimpleItemDescription Name="IsRecording" Type="xs:boolean"/>
  </tt:Data>
</tt:MessageDescription>
```

This message is sent whenever a client starts or stops recording for a specific recording. At start recording, IsRecording shall be set to true. At stop recording, IsRecording shall be set to false.

**Topic:** tns1:RecordingHistory/Track/State

```xml
<tt:MessageDescription IsProperty="true">
  <tt:Source>
    <tt:SimpleItemDescription Name="RecordingToken" Type="tt:ReferenceToken"/>
  </tt:Source>
  <tt:Data>
    <tt:SimpleItemDescription Name="Track" Type="tt:ReferenceToken"/>
    <tt:SimpleItemDescription Name="IsDataPresent" Type="xs:boolean"/>
  </tt:Data>
</tt:MessageDescription>
```
This message signals when the data for a track is present. When the data becomes present, a message with IsDataPresent set to true shall be sent. When the data becomes unavailable, the message with IsDataPresent set to false shall be sent.

A device MAY generate the following events. If the device supports these events, it shall always automatically records these notification messages so that clients can always use FindEvent for these messages.

**Topic: tns1:RecordingHistory/Track/VideoParameters**

```xml
<tt:MessageDescription IsProperty="true">
  <tt:Source>
    <tt:SimpleItemDescription Name="Recording" Type="tt:ReferenceToken"/>
    <tt:SimpleItemDescription Name="Track" Type="tt:ReferenceToken"/>
  </tt:Source>
  <tt:Data>
    <tt:SimpleItemDescription Name="VideoEncoding" Type="tt:VideoEncoding"/>
    <tt:SimpleItemDescription Name="VideoWidth" Type="xs:int"/>
    <tt:SimpleItemDescription Name="VideoHeight" Type="xs:int"/>
    <tt:ElementItemDescription Name="VideoRateControl" Type="tt:VideoRateControl"/>
  </tt:Data>
</tt:MessageDescription>
```

**Topic: tns1:RecordingHistory/Track/AudioParameters**

```xml
<tt:MessageDescription IsProperty="true">
  <tt:Source>
    <tt:SimpleItemDescription Name="Recording" Type="tt:ReferenceToken"/>
    <tt:SimpleItemDescription Name="Track" Type="tt:ReferenceToken"/>
  </tt:Source>
  <tt:Data>
    <tt:SimpleItemDescription Name="AudioEncoding" Type="tt:AudioEncoding"/>
    <tt:SimpleItemDescription Name="AudioSampleRate" Type="xs:int"/>
    <tt:SimpleItemDescription Name="AudioBitrate" Type="xs:int"/>
  </tt:Data>
</tt:MessageDescription>
```

The device shall send either message (depending on the track data type) whenever any of these properties change.

### 5.20 Xpath dialect

This section defines the XPATH dialect that a device that realises the search service shall implement to parse the Xpath strings that are passed to the methods of the search service.

Dialect=http://www.onvif.org/ver10/tse/searchFilter

[1] Expression ::= BoolExpr | Expression 'and' Expression
                  | Expression 'or' Expression | '('Expression')' | 'not' '('Expression')'
Example of an XPath expression used to find recordings from the basement where there is at least one track containing video:

```xml
boolean(//Source[Location = "Basement"]) and
boolean(//Track[TrackType = "Video"])
```

### 5.21 Service specific data types

#### 5.21.1 SearchScope

A structure for defining a limited scope when searching in recorded data.

```xml
<xs:complexType name="SearchScope">
  <xs:element name="IncludedSources" type="tt:SourceReference" minOccurs="0" maxOccurs="unbounded"/>
  <xs:element name="IncludedRecordings" type="tt:RecordingReference" minOccurs="0" maxOccurs="unbounded"/>
  <xs:element name="RecordingInformationFilter" type="tt:XpathExpression" minOccurs="0"/>
</xs:complexType>
```

- **IncludedSources**
  A list of sources that are included in the scope. If this list is included, only data from one of these sources shall be searched.

- **IncludedRecordings**
  A list of recordings that are included in the scope. If this list is included, only data from one of these recordings shall be searched.

- **RecordingInformationFilter**
  An XPath expression used to specify what recordings to search. Only those recordings with an RecordingInformation structure that matches the filter shall be searched.

- **Extension**
  Extension point

#### 5.21.2 EventFilter

```xml
<xs:complexType name="EventFilter">
  <xs:extension base="wsnt:FilterType"/>
</xs:complexType>
```

#### 5.21.3 PTZPositionFilter

```xml
<xs:complexType name="PTZPositionFilter">
</xs:complexType>
```
• **MinPosition**
  The lower boundary of the PTZ volume to look for.

• **MaxPosition**
  The upper boundary of the PTZ volume to look for.

• **EnterOrExit**
  If true, search for when entering the specified PTZ volume.

5.21.4 MetadataFilter

```xml
<xs:complexType name="MetadataFilter">
  <xs:element name="MetadataStreamFilter" type="tt:XpathExpression"/>
</xs:complexType>
```

• **MetadataStreamFilter**

5.21.5 FindRecordingResultList

```xml
<xs:complexType name="FindRecordingResultList">
  <xs:element name="SearchState" type="tt:SearchState"/>
  <xs:element name="RecordingInformation" type="tt:RecordingInformation" minOccurs="0" maxOccurs="unbounded"/>
</xs:complexType>
```

• **SearchState**
  The state of the search when the result is returned. Indicates if there can be more results, or if the search is completed.

• **RecordingInformation**
  A RecordingInformation structure for each found recording matching the search.

5.21.6 FindEventResultList

```xml
<xs:complexType name="FindEventResultList">
  <xs:element name="SearchState" type="tt:SearchState"/>
  <xs:element name="Result" type="tt:FindEventResult" minOccurs="0" maxOccurs="unbounded"/>
</xs:complexType>
```

• **SearchState**
  The state of the search when the result is returned. Indicates if there can be more results, or if the search is completed.

• **Result**
  A FindEventResult structure for each found event matching the search.

5.21.7 FindEventResult

```xml
<xs:complexType name="FindEventResult">
  <xs:element name="RecordingToken" type="tt:RecordingReference"/>
  <xs:element name="TrackToken" type="tt:TrackReference"/>
  <xs:element name="Time" type="xs:dateTime"/>
  <xs:element name="Event" type="wsnt:NotificationMessageHolderType"/>
  <xs:element name="StartStateEvent" type="xs:boolean"/>
</xs:complexType>
```

• **RecordingToken**
  The recording where this event was found. Empty string if no recording is associated with this event.
• **TrackToken**
  A reference to the track where this event was found. Empty string if no track is associated with this event.

• **Time**
  The time when the event occurred.

• **Event**
  The description of the event.

• **StartStateEvent**
  If true, indicates that the event is a virtual event generated for this particular search session to give the state of a property at the start time of the search.

### 5.21.8 FindPTZPositionResultList

```xml
<xs:complexType name="FindPTZPositionResultList">
  <xs:element name="SearchState" type="tt:SearchState"/>
  <xs:element name="Result" type="tt:FindPTZPositionResult" minOccurs="0" maxOccurs="unbounded"/>
</xs:complexType>
```

• **SearchState**
  The state of the search when the result is returned. Indicates if there can be more results, or if the search is completed.

• **Result**
  A FindPTZPositionResult structure for each found PTZ position matching the search.

### 5.21.9 FindPTZPositionResult

```xml
<xs:complexType name="FindPTZPositionResult">
  <xs:element name="RecordingToken" type="tt:RecordingReference"/>
  <xs:element name="TrackToken" type="tt:TrackReference"/>
  <xs:element name="Time" type="xs:dateTime"/>
  <xs:element name="Position" type="tt:PTZVector"/>
</xs:complexType>
```

• **RecordingToken**
  A reference to the recording containing the PTZ position.

• **TrackToken**
  A reference to the metadata track containing the PTZ position.

• **Time**
  The time when the PTZ position was valid.

• **Position**
  The PTZ position.

### 5.21.10 FindMetadataResultList

```xml
<xs:complexType name="FindMetadataResultList">
  <xs:element name="SearchState" type="tt:SearchState"/>
  <xs:element name="Result" type="tt:FindMetadataResult" minOccurs="0" maxOccurs="unbounded"/>
</xs:complexType>
```

• **SearchState**
  The state of the search when the result is returned. Indicates if there can be more results, or if the search is completed.

• **Result**
  A FindMetadataResult structure for each found set of Metadata matching the search.
5.21.11 FindMetadataResult

```xml
<xs:complexType name="FindMetadataResult">
  <xs:element name="RecordingToken" type="tt:RecordingReference"/>
  <xs:element name="TrackToken" type="tt:TrackReference"/>
  <xs:element name="Time" type="xs:dateTime"/>
</xs:complexType>
```

- **RecordingToken**
  A reference to the recording containing the metadata.

- **TrackToken**
  A reference to the metadata track containing the matching metadata.

- **Time**
  The point in time when the matching metadata occurs in the metadata track.
